

Near-Infrared RV Spectrographs

Claire Moutou, Ansgar Reiners, Motohide Tamura, François Bouchy

Near-infrared RV spectrographs have started operations a few years ago. The goal of this splinter session is to present performances, strengths, and limitations of nIR RV measurements. By putting together the concerned instrumental teams, we aim at comparing lessons learned from first years of data and share knowledge about instrumental behavior as well as pipeline challenges -in particular telluric correction and RV measurement. It can also be the place for presentations of recent science results with nir RV spectrographs, especially related to stellar activity and planet search.
