

# WFIRST and Solar System Science

David E. Trilling

Northern Arizona University

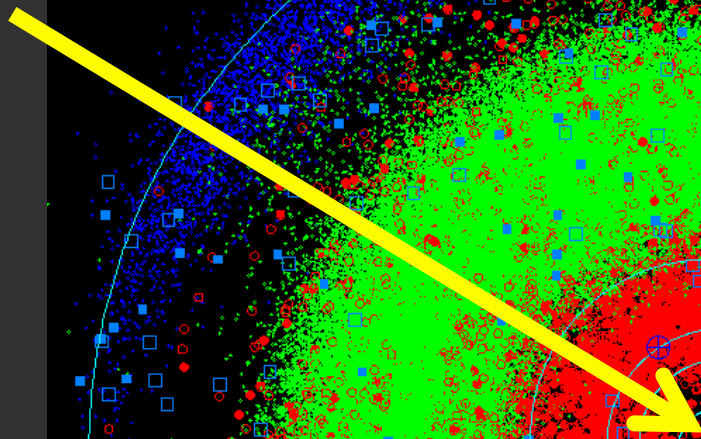

# Intro to the Solar System

The formation and evolution of the Solar System can be learned from studying the properties of millions of small bodies

Plot prepared by the Minor Planet Center (2013 Jan.24).

Sun

Plot prepared by the Minor Planet Center (2013 Jan.24).

Earth's orbit

Sun

# At this scale the nearest star is at LAX

Kuiper  
Belt  
Objects

Pluto

Solar System objects move

Moving objects move

# Moving objects move

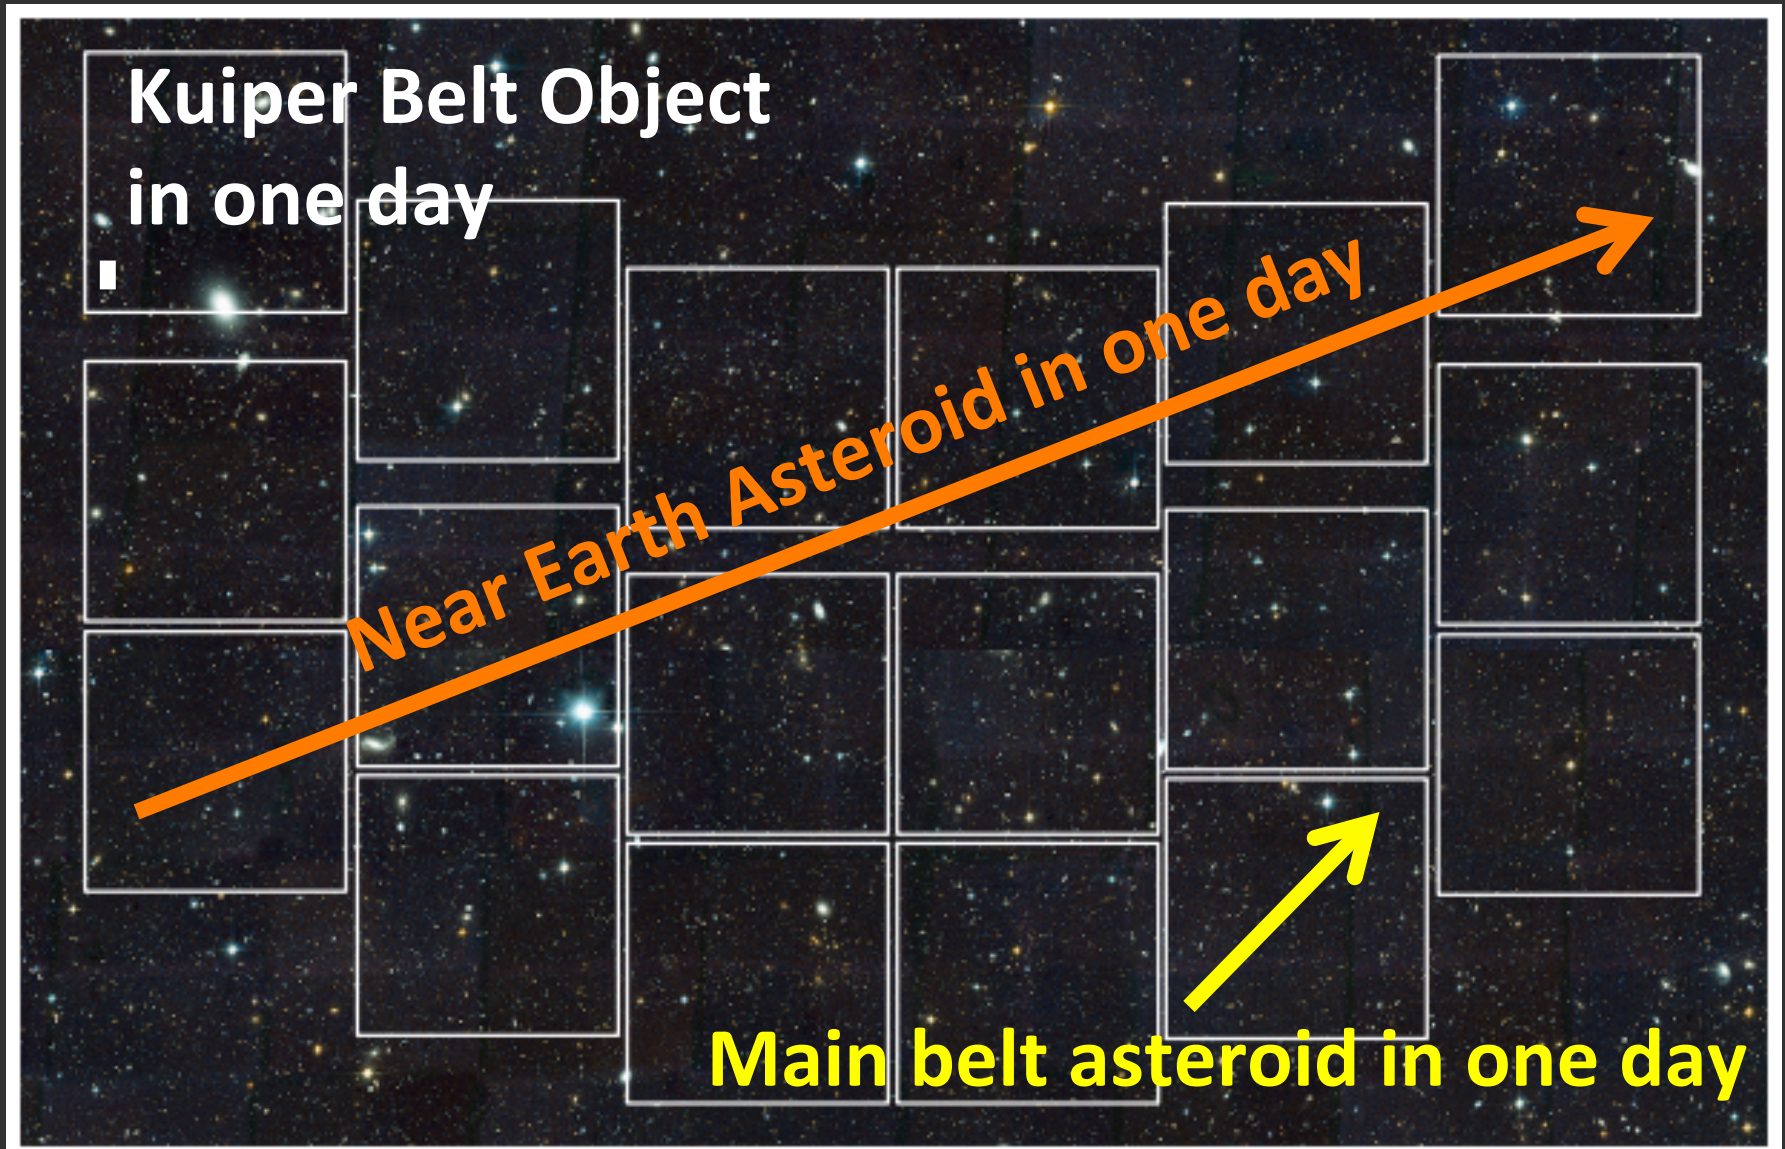

HST/ WFPC2  
Evans et al. 1998

# Moving objects move

- Rates of motion: From 1—100"/hour
- Impacts both GI and GO science (if there is no **non-sidereal observing**; more on this later)

# Moving objects move

# Science investigations

# Guest Investigator science

# Guest Investigator science

- Archive: only WFI data is going to be useful

# Guest Investigator science

If **NO** repeat:

- Only trailed objects (trails up to 30-50 pixels)
- Statistical population properties (how many, how bright) as derived from trails
- Lessons learned from Pan-STARRS (example: Near Earth Asteroid lightcurves measured in the trail)

# Guest Investigator science

If **YES** repeat:

- Slow moving outer Solar System objects (connect the dots)
- Individual object properties

1 arcmin x 1 arcmin

1 arcmin x 1 arcmin

# Guest Investigator science

Andy Gould (2014):

- KBO orbits
- Binary KBOs
- Occultations

# Guest Observer science

# Guest Observer science

- Without **non-sidereal observing**, only WFI will be useful

# Guest Observer science: WFI

- Near Earth Asteroids (10 sec exposures)
- Main Belt Asteroids (30 sec exposures)
- Kuiper Belt Objects (270 sec exposures)

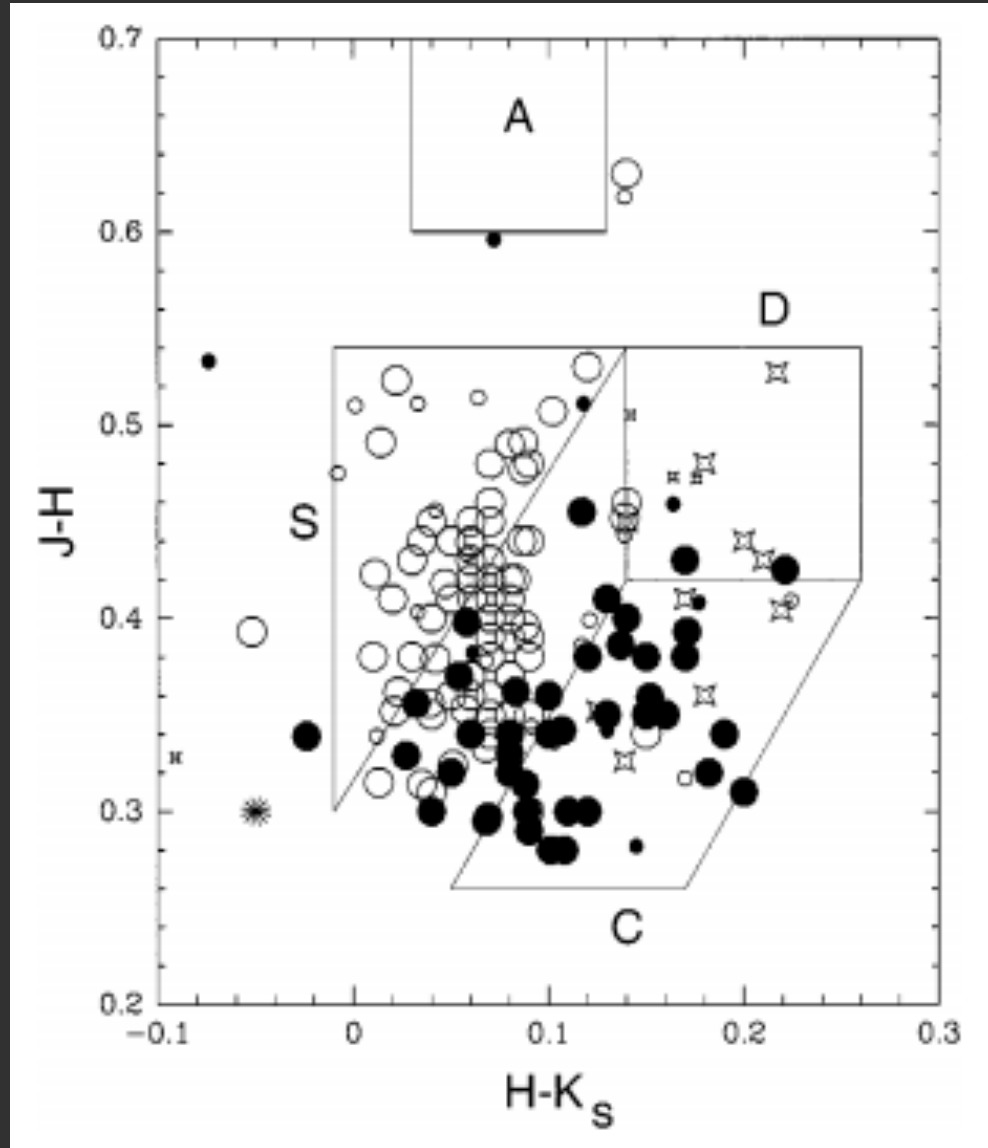

# Guest Observer science: WFI

Near Earth  
Asteroids:  
UKIRT  
Mommert  
et al.

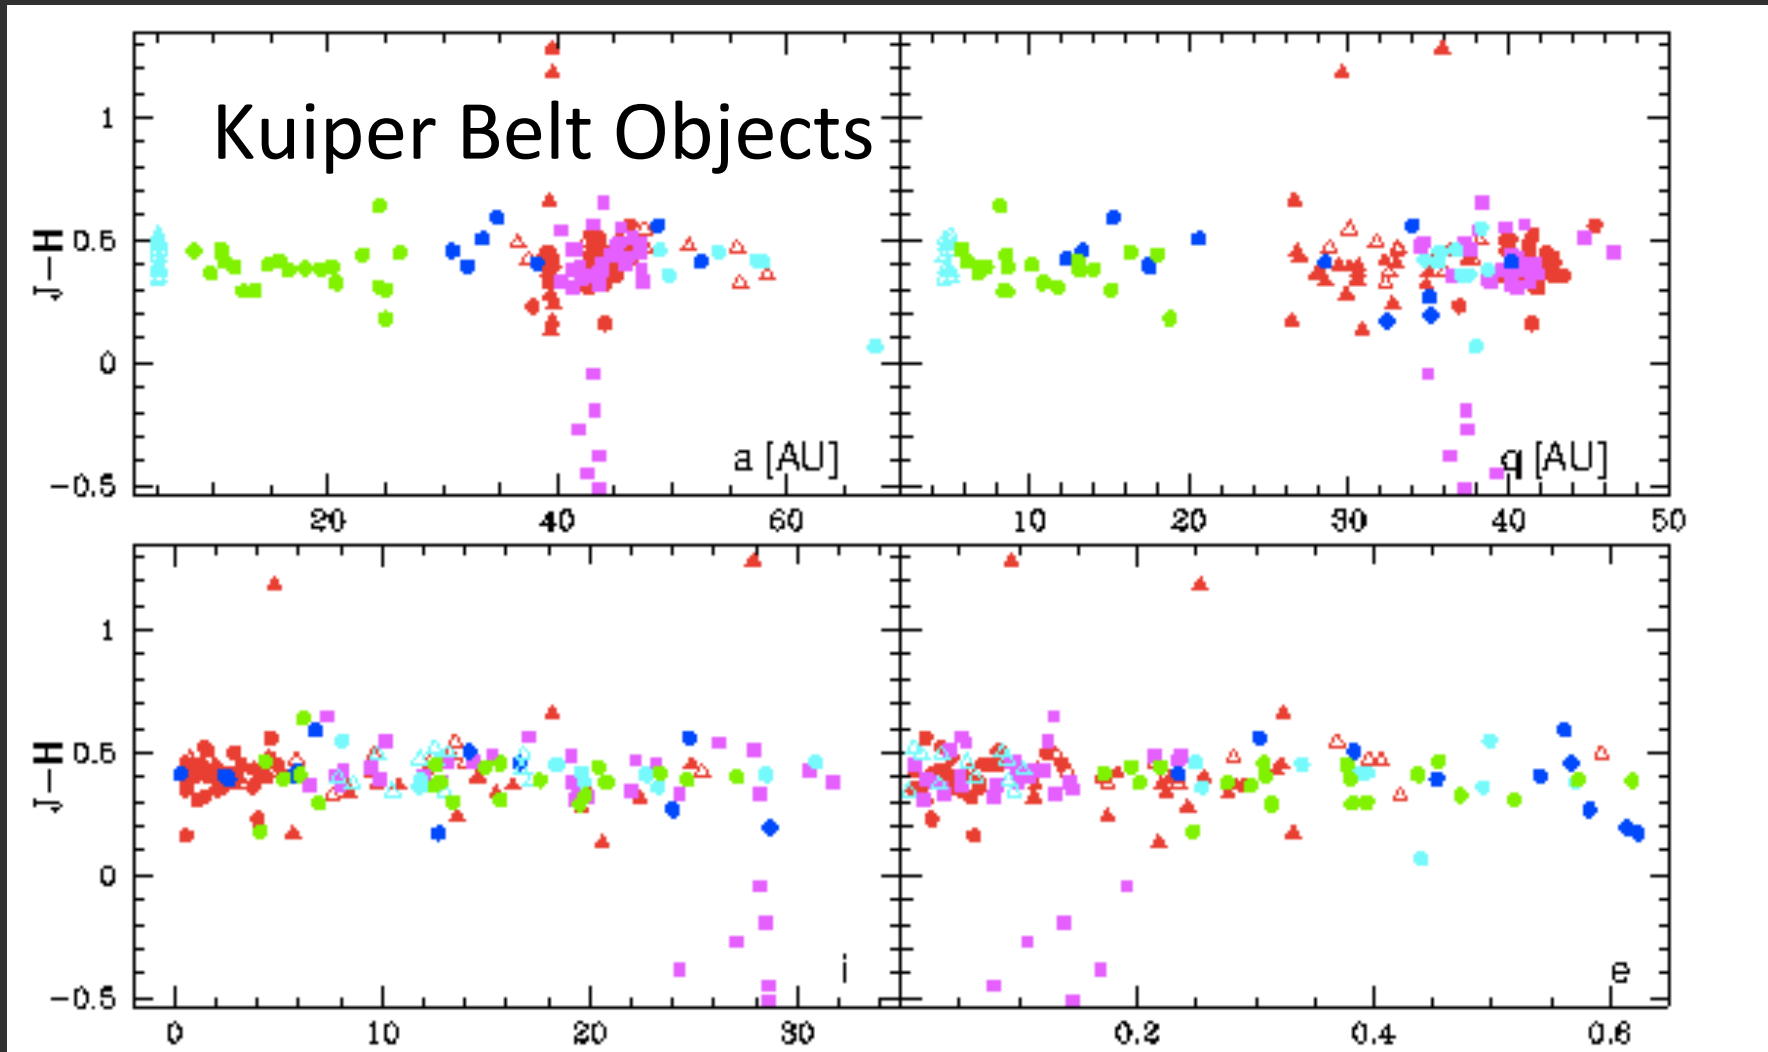

# Guest Observer science: WFI

Main Belt  
Asteroids:  
2MASS  
Sykes et al.

# Guest Observer science: WFI

# Non-sidereal observing

# Non-sidereal observing

- Opens a whole new world for dedicated studies

# Non-sidereal observing

- Opens a whole new world for dedicated studies
- WFI:
  - Characterization of (**very**) faint objects through long integrations
  - **Every** known Kuiper Belt Object
  - Almost every known Near Earth Asteroid

# Non-sidereal observing

- Opens a whole new world for dedicated studies
- IFU:
  - Spectra of (**very small**) Near Earth Asteroids
  - Separate spectra of binary components
  - Ice **compositions** in the outer Solar System

# Non-sidereal observing

- Opens a whole new world for dedicated studies
- Coronagraphy:
  - Satellites of Kuiper Belt Objects
  - Active asteroids

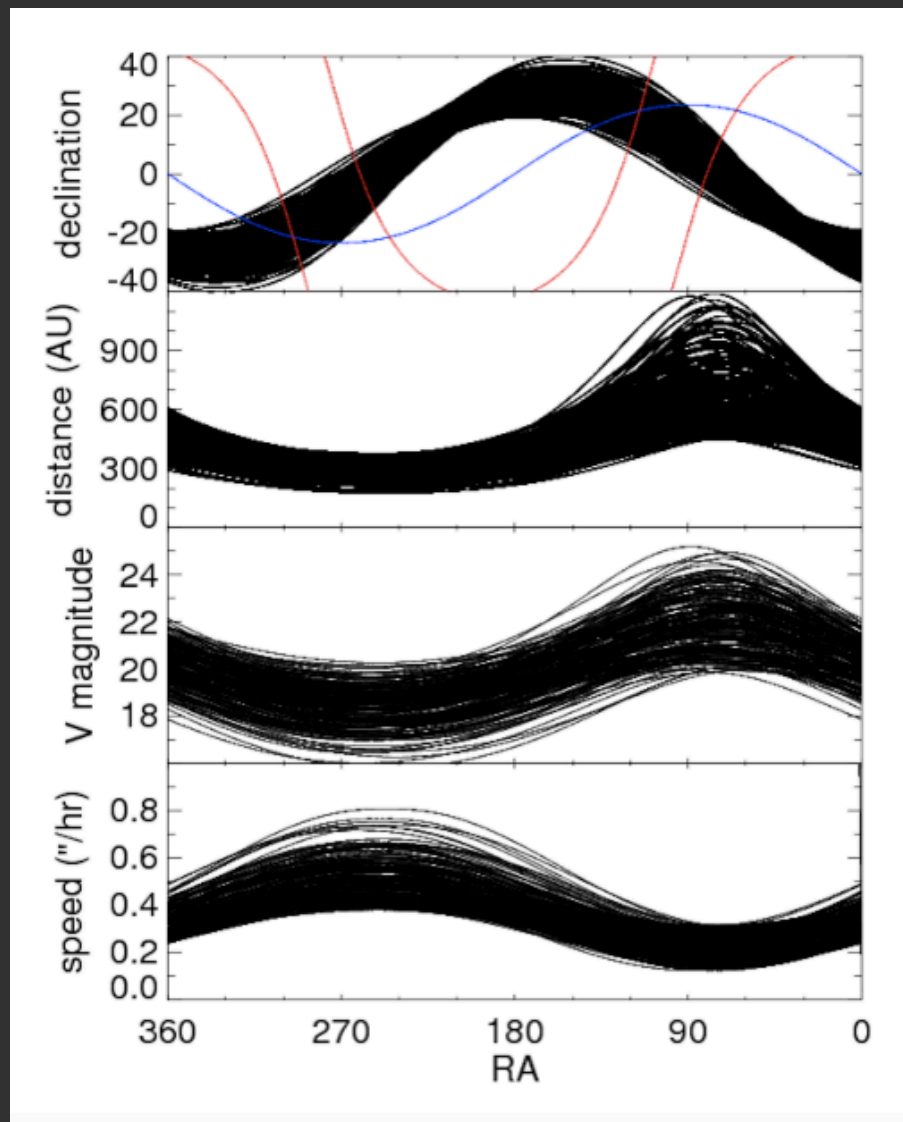

# Non-sidereal observing

- Opens a whole new world for dedicated studies
- Could say much more, but trying to stay “high level”

# Planet Nine

# Planet Nine

Recently predicted  
Neptune-sized object  
at  $\sim 500$  AU

# Planet Nine

- WFI: Search for Planet Nine
- WFI/IFU: Characterize atmosphere
- Cor.: Search for moons, rings, ....

# Other assets

# Other assets

- **JWST**: Highly complementary
- **LSST** asteroids in WFIRST FOV will be strongly detected (and further characterized)
- **NEOCam** (proposed Discovery mission): Add NIR characterization to thermal IR discovery (but overlap might be small because of orbits)

# Conclusions

# Conclusions

- Use WFIRST to study small Solar System bodies
- WFI/GI: KBOs, also Near Earth Asteroids
- WFI/GO: KBOs, asteroid characterization

If **non-sidereal observing** is possible

- Many additional projects (WFI, Cor.)

Other **assets**

- Highly complementary to LSST, JWST; less so for NEOCam
